

CLAIM AMENDMENTS

1. (Currently amended) A method of facilitating the future contracting of agricultural commodities using the Internet comprising the steps of:
providing a Web server connected to the Internet;
providing a centralized database system for the storage and retrieval of data;
storing data in the database system relating to types and amounts of agricultural commodities desired by one or more agricultural commodity buyers and establishing a defined allocation of an amount of a type of agricultural commodity according to at least one allocation parameter, wherein at least one of the at least one allocation parameter is set to reduce risk associated with future contracting of agricultural commodities;
in response to a command input into the system, displaying a listing of desired commodities including information related to the types, amounts or deliveries of the commodities;
receiving input data from a supplier of an agricultural commodity relating to a specific type and amount of a commodity which the supplier is willing to supply to a buyer at harvest or at other times; and
generating a contract for the sale of the specific type and amount of the commodity by the supplier to the buyer.
2. (Original) The method of claim 1 wherein information inputted into the system is inputted via a Web browser.
3. (Original) The method of claim 1 wherein information inputted into the system is

inputted via an applet in Java or another program language.

4. (Original) The method of claim 1 wherein the agricultural commodities are comprised of agricultural products.

5. (Original) The method of claim 1 wherein the agricultural commodities are comprised of commodity grains or oilseeds.

6. (Previously presented) The method of claim 1 wherein the agricultural commodities are comprised of fruits or vegetables.

7. (Original) The method of claim 1 wherein the agricultural commodities are comprised of animals or fish.

8. (Original) The method of claim 1 wherein the agricultural commodities are comprised of horticultural products or ornamental plants.

9. (Original) The method of claim 4 wherein the step of storing data in the database system relating to types and amounts of agricultural commodities further comprises the steps of: storing data identifying a quantity of agricultural products desired by the buyer; and storing data related to a desired allocation of the quantity of agricultural products among a plurality of areas.

10. (Original) The method of claim 4 wherein the step of displaying a listing of desired commodities further comprises the steps of: displaying a listing of desired agricultural products available in desired areas; and updating the listing to reflect a change in data as a result of contracting between the supplier and the buyer.

11. (Original) The method of claim 1 wherein the contract generated is a paper contract.

12. (Original) The method of claim 1 wherein the contract generated is an electronic contract executed using digital signatures.

13. (Currently amended) A method of facilitating and tracking the future contracting of agricultural crops using a wide area distributed network comprising the steps of: providing a centralized database system for the storage and retrieval of data; storing data related to the number of acres or bushels of agricultural crops desired by one or more agricultural commodity buyers and establishing a desired allocation of an amount of a type of agricultural product available to a grower according to at least one allocation parameter, wherein the at least one allocation parameter is set to reduce risk associated with future contracting of agricultural commodities; storing data related to the number of acres or bushels of the agricultural crops committed for the production of the crops by one or more growers; displaying a listing of the desired crops including information related to the number of acres or

bushels desired and the number of acres or bushels already committed;
receiving input data from a grower relating to a specific amount of the crop which the grower is
willing to commit to the desired agricultural crop; and
updating the data in the database to reflect the additional acres committed by the grower as
indicated in the input data so that the listing of the desired crops can be displayed in real
time showing the allocation of acres or bushels committed to the desired crop.

14. (Original) The method of claim 13 further comprising electronically managing
delivery times and methods.

15. (Original) The method of claim 13 further comprising electronically managing
quality data for growing or delivered products.

16. (Original) The method of claim 13 further comprising electronically pricing the
contract based on a variable.

17. (Previously presented) The method of claim 16 wherein the variable is selected
from the set comprising time of delivery and a quality measure.

18. (Original) The method of claim 13 wherein the centralized database system is installed on an
Internet Web server, and users of the database system access the database system via an Internet
Web browser.

19. (Original) The method of claim 18 wherein the centralized database system is installed on an Internet Web server, and users of the database system access data using Java or another applet.

20. (Original) The method of claim 13 wherein the agricultural crops further comprise agricultural products.

21. (Original) The method of claim 13 further comprising the step of allocating the stored data relating to the number of acres of agricultural crops desired among a plurality of elevators.

22. (Original) The method of claim 13 further comprising the step of allocating the data related to the number of acres of the agricultural crops desired into distinct geographic regions.

23. (Original) The method of claim 13 further comprising the step of allocating the data according to one of the following: product type, time of delivery, method of delivery, end-user buyer.

24. (Cancelled)

25. (Currently amended) An apparatus for future contracting for agricultural commodities over a wide area distributed network comprising:

an application/web server;

a database server;

a communications link between the application/web server and the database server and the wide area distributed network;

one or more remote user terminals;

software on computer storage medium which facilitates:

storing data in the database system relating to types and amounts of agricultural commodities desired by one or more agricultural commodity buyers and establishing a desired allocation of an amount of a type of agricultural commodity available to a user of the apparatus according to at least one allocation parameter, wherein at least one of the at least one allocation parameter reduces associated risks of the one or more agricultural commodity buyers;

in response to a command input into the system, displaying a listing of desired commodities including information related to the types, amounts or deliveries of the commodities;

receiving input data from a supplier of an agricultural commodity relating to a specific type and amount of a commodity which the supplier is willing to supply to the buyer at harvest or at other times; and

generating a contract for the sale of the specific type and amount of the commodity by the supplier to the buyer.

26. (Currently amended) A system for future contracting for agricultural commodities over a wide area distributed network comprising:

a central computer system in operative communication with a wide area distributed network;

a plurality of widely distributed seller computers in operative communication with the wide area distributed network;

a plurality of widely distributed buyer computers in operative communication with the wide area distributed network;

a database stored on said central computer system containing data related to specific type and amount of a commodity which the seller is willing to supply to the buyer at harvest or at other times, and types and amounts of agricultural commodities desired by one or more agricultural commodity buyers and establishing a desired allocation of a quantity of a type of agricultural product available to a user of the system according to at least one allocation parameter, wherein the at least one allocation parameter is set to reduce associated risks of contracting for an agricultural commodity to be grown and delivered; so that, in response to a command input into the system, buyers and sellers can form contracts related to the types, amounts or deliveries of the commodities.

27. (Original) The system of claim 26 further comprising a software security component to restrict access to the system.

28. (Original) The system of claim 27 wherein the software security component comprises varying levels of access to data by authorized users of the system.

29. (Currently amended) A method of facilitating the customizable future contracting of agricultural commodities using the Internet between counter parties outside of conventional commodities exchanges comprising the steps of:

providing a Web server connected to the Internet;

providing a centralized database system for the storage and retrieval of data;

storing data in the database system relating to types and amounts of agricultural commodities desired by one or more agricultural commodity buyers and establishing a defined allocation of an amount of a type of agricultural commodity according to at least one allocation parameter, wherein at least one of the at least one allocation parameter is set to reduce risk associated with future contracting of agricultural commodities;

in response to a command input into the system, displaying a listing of desired commodities including information related to the types, amounts or deliveries of the commodities;

receiving input data from a supplier of an agricultural commodity relating to a specific type and amount of a commodity which the supplier is willing to supply to a buyer at harvest or at other times; and

generating a customized contract for the sale of the specific type and amount of the commodity by the supplier to the buyer.
